**Title**

**HPE Shadowbase Product Suite Update**

**Abstract**

Learn about new and upcoming Shadowbase product features, including: *Shadowbase ZDL™*, synchronous data replication that delivers zero data loss when disaster strikes (future enhancements will also enable active/active architectures where data collisions are eliminated, allowing truly flexible "route-anywhere" continuous processing models); IBM DB2 as a data source for Shadowbase replication; enhanced support for Sybase IQ and Teradata columnar target databases; major enhancements to our Oracle Log Source product; new features to enable migration of BASE24 non-audited files into supported Shadowbase audited environments; and additional enhancements for HPE NonStop Enscribe and SQL including 'exact' SYSKEY replication, long record and row replication, and large key replication. We will also discuss Shadowbase support status for HPE NonStop S-series systems.
