Title

It's Slow! - Now What?

Abstract

Quite often the problem statement originates as "It is slow". And just as often, there is a lot more to the story. This session covers the identification and analysis steps used to pinpoint application and system performance "hot spots" frequently contributing to "slow". Topic areas include CPU bound, IO bound and contention bound environments including RMS files, alignment faults, code compilation options, caches, buffering, etc. No application developer or system manager should miss this session. .
